

F# | > I ♥

Róbert Fuszenecker, 2016

# About F#

- Functional first programming language
  - Also supports object-oriented and imperative programming
- Full citizen .NET language
  - Can be compiled to i.e. JavaScript
- Strongly typed with type inference

# About F# 2

- For application development and scripting (tools)
- Support exists for
  - Visual Studio, Visual Studio Code,
  - Xamarin Studio / MonoDevelop
  - Atom, vim, emacs...
  - LINQPad, DotNetFiddle
- Open-sourced ab ovo: Microsoft's first OSS project

# History

- From engineering side (Turing-machine)

Machine Code → Assembly → C → C++ → Java → C#

- From scientific side ( $\lambda$ -calculus, Alonzo Church, 1930s)

IPL → LISP → ML → SML → Caml → OCaml → F#

# Functional programming

- Functions are first-class citizens
- Data is immutable by default
- The application evaluates expressions, functions and returns the result
  - Transforms the immutable state to a new state
  - Functions don't have any side effects
- Information can come from data sources or event sources
- Ideal for scientific and GPU computations

# Don Syme's recommendation

- If you don't need mutable values (state), use FP
- If you need to store mutable values, use OOP

# Demo
